Functions for rebinning input data.

test **.mira2nc** (*x*)

High-level API to convert Mira cloud radar Level 1 file into NetCDF file.

This function converts raw cloud radar file into a much smaller file that contains only the relevant data and can be used in further processing steps.

Args: `mmclx_file` (str): Raw radar file in NetCDF format. `output_file` (str): Output file name. `site_properties` (dict): Dictionary containing information about the site. Required key value pairs are 'name'.

rebin_data (bool, optional): **If True, rebins data to 30s resolution.** Otherwise keeps the native resolution. Default is False.

Examples:

INDICES AND TABLES

- `genindex`
- `modindex`
- `search`
